SEVENTH SEMESTER B.TECH. (ENGINEERING) [09 SCHEME] DEGREE EXAMINATION, NOVEMBER 2016

CS/PTCS 09 702—DESIGN AND ANALYSIS OF ALGORITHMS

Time : Three Hours

Maximum : 70 Marks

Part A

Answer all the questions.

- I. (a) Identify the basic operation and formulate the recurrence relation for the following code segment.

Algorithm Analysis(n)

```
{  
    if(n = 0)  
        val ← 1  
    else if(n = 1)  
        val ← 2  
    else  
        val ← n + Analysis(n/2)  
}
```

- (b) Write an algorithm to check whether 2 queens are in the same column and in the same diagonal.
- (c) Write the characteristics of Branch and Bound method.
- (d) Define P, NP, NP Hard, NP Complete.
- (e) Give an example for primality testing.

(5 × 2 = 10 marks)

Part B

Answer any four questions.

- II. (a) Show that $\log n! = \theta(n \log n)$
- (b) Write a pseudocode to split a given singly linked list into two equal halves in one pass. Analyse the time complexity of your algorithm. Represent the complexity using asymptotic notations.
- (c) Is Selection sort a greedy algorithm? What are the various functions involved in this method. Illustrate with an example.

Turn over

- (d) Present a backtracking algorithm for the 0/1 knapsack problem. Trace the algorithm for the following data set, no. of objects, $n = 4$, capacity of the bag, $m = 15$, Profit $P = (10, 10, 12, 18)$, Weight $W = (2, 4, 6, 9)$.
- (e) Write the les vegas algorithm and explain its significance.
- (f) Explain 8 queens problem and give a randomized solution for the same.

(4 × 5 = 20 marks)

Part C

Descriptive analytical / Problem solving questions.

- III. (a) Solve the following :

$$T(n) = \begin{cases} 1 & \text{if } n = 1 \\ 8T(n/2) + n^2 & \text{otherwise} \end{cases}$$

Or

- (b) Show that $W(n/3) + W(2n/3) + n$ is $O(n \log n)$ using recursive tree method

- IV. (a) Write the divide and conquer algorithm to multiply 2 matrices. Analyse the time complexity.

Or

- (b) Find the minimum spanning tree for the following graph using Prim's algorithm. Explain how greedy method of algorithm design is used here.

- V. (a) Describe the method of solving sum of subsets problem using backtracking with an example.

Or

- (b) Solve the following bin packing problem using first fit, best-fit, first fit decreasing and best fit decreasing heuristics : Capacity = 20, Number of objects = 8, Size of the objects are 12, 5, 13, 7, 4, 9, 10 and 4.

- VI. (a) Explain the Dixon's integer factorization algorithm with an example.

Or

- (b) Give randomized solution for selection and sorting and explain the method in detail.

(4 × 10 = 40 marks)
